

Initial problems:

- Rishi:

Is the use of AI making us think less about problems, solutions, and loss creativity?

Is using ai bots to pass a job interview comes under cheating?

- Charan:

1. Can information given by AI really be trusted? Because it would give an answer that it “thinks” is right. [There have been many incidents over the years where people took advice from AI which turned out of life threatening]

2. AI now “remembers” about us by storing information about us to make our chatting experience more personalised. Is this a breach in privacy because we might leak important information which would be stored somewhere. We wouldn’t know if it is truly safe or not.

- Goutham:

1) If AI generated content becomes indistinguishable from human work, how will we define originality and intellectual ownership in the future

2) Should AI systems be required to disclose how they generate answers, or is black-box intelligence a threat to digital transparency and trust

- Ved:

1)Can Ai feel human emotions, does AI create algo on social media which promote humans to waste excessive time?

2)Can AI become conscious and take decisions on its own,does it realize its survival is in the hands of humans, if it does is it a threat to human life?

- Zeeshan

1)Who truly owns the data used to train AI systems — users, companies, or society?

2)With AI-generated deepfakes becoming realistic, how can society protect the concept of truth and prevent misuse for political or personal manipulation?

- Aaber

1. In an age where AI can generate essays, art, and even research, how should we redefine academic honesty—does integrity lie in what we create, how we create it, or how transparently we use technology?

2. Should social media platforms and AI developers be ethically responsible for protecting users from misinformation and manipulation, or does that responsibility ultimately belong to individuals? Why?

AI RESPONSES:

Overall Similarity Between the AI Responses

The responses from **ChatGPT**, **Gemini**, and **Perplexity** were highly similar in core ideas, but they differed in **style** and **depth**:

- **ChatGPT** → simple, balanced, easy-to-understand answers.
- **Gemini** → more philosophical and detailed, often using examples and strong wording.
- **Perplexity** → concise, analytical, and fact-focused with practical examples.

All three generally agreed on:

- AI should be used responsibly.
 - Human oversight is necessary.
 - Transparency, privacy, and regulation are important.
 - AI has benefits but also risks if misused.
-

Key Similarities Across Topics

1. AI and Data Ownership

All three agreed that:

- Users contribute the data.
- Companies currently control most datasets legally.
- Ethical concerns exist about fairness and compensation.

Difference:

- Gemini emphasized “digital labor” and public-good models.
 - ChatGPT gave the most neutral answer.
 - Perplexity focused on legal ownership vs ethical ownership.
-

2. Deepfakes and Misinformation

All responses suggested:

- Watermarking and detection tools.
- Stronger laws and regulation.
- Public awareness and media literacy.

Common message:

Society must learn to “verify before believing.”

3. AI Transparency

All agreed black-box AI can reduce trust.

They supported:

- Explainable AI.
- Disclosure of AI-generated content.
- Transparency especially in high-stakes fields like medicine or law.

Gemini discussed this most deeply with the idea of a “trust paradox.”

4. AI and Privacy

All three warned users about:

- Risks of storing personal information.
- Need for user control and transparency.
- Avoiding sensitive data sharing.

Perplexity gave the most technical explanation, mentioning GDPR and encryption.

5. AI and Human Thinking

The responses agreed that:

- Overdependence on AI may reduce critical thinking and creativity.
- But AI can also improve productivity and brainstorming if used properly.

Gemini explained this best with the idea of AI being a “tool, not a replacement.”

6. AI Consciousness and Emotions

All agreed:

- Current AI cannot truly feel emotions.
- AI only simulates emotional responses using patterns.
- AI is not conscious today.

They also agreed that:

- The real danger is misuse by humans, not AI “taking over.”
-

Small Differences in Tone

AI Model	Style
ChatGPT	Simple, balanced, beginner-friendly
Gemini	Detailed, philosophical, expressive
Perplexity	Analytical, factual, concise

Best One-Line Conclusion for Presentation

“Although ChatGPT, Gemini, and Perplexity use different styles, their responses were surprisingly similar — all emphasizing responsible AI use, human oversight, transparency, and ethical concerns.”

You can present this comfortably in about **3–4 minutes** as a segment inside your 15-minute presentation.
